DETAILED ACTION

Allowable Subject Matter

1. Claims 3-5 and 34 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1, 2, 6, 32 and 33 rejected under 35 U.S.C. 103(a) as being unpatentable over Matsuo et al. (6,7373,716) in view of Wallace et al. (6,291,867)

Regarding Claims 1, 2, 6, 32 and 33, Matsuo et al. disclose a semiconductor device and method of manufacturing the same with formation of multilayer gate insulating film containing metal where in Fig. 9, layer 82 is a TiSiON layer. Matsuo et al. fail to disclose the required high dielectric constant film containing metal, silicon and oxygen, the required position for the film on top of this metal/silicon/oxygen/nitrogen insulating film and the required amorphous barrier film. However, Wallace et al. discloses zirconium and/or hafnium silicon-oxynitride gate dielectric where in Figs. 1-19, to topmost layers i.e. 36, 38, 40, 42 are Hafnium/Zirconium silicon-oxynitride layers and therefore contain metal, silicon and oxygen. Furthermore, in column 5, lines 50-56, the

required configuration for the barrier and the high dielectric layer is disclosed. Finally, Yokoyama et al. disclose a semiconductor memory device and production method of the same where in Fig. 5, element 3 is an amorphous barrier film.

It would have been obvious to one of having ordinary skill in the art at the time the invention was made to include the required high dielectric film and the required amorphous barrier film in Matsuo et al. as taught by Wallace et al. and Yokoyama et al. respectively, in order to have a gate insulating layer of higher reliability.
